**Waterways
Environmental**

At **Waterways Environmental** we have an innovative approach to design suitable rainwater harvesting systems. As we are not affiliated to any tank manufacturer, we can offer the largest range of tanks, above or below ground in either plastic, GRP or concrete.

Rain Water Harvesting Tanks

For our above ground range, usually used in an existing property, we can offer a variety of standard circular or slim line options like column or rectangular. Our tanks range from 200L to 200,000L in 1 tank. Many systems are supplied with tanks to suit appearance whilst our below ground range are about proximity, depth, strength and material preference.

Beyond the choice of tanks - "filtering, pumps and controls" are carefully selected to ensure the system is reliable, with

Filter Range

sufficient flow and pressure and as maintenance free as possible. Most of our filters are wash through self maintaining filters and all of our pumps carry full manufacturers warranties of 3 years plus and are designed to last in excess of any of the warranties offered.

The harvested water can be used for your toilets, washing machines and for outdoor use. In addition to the standard sediment filters, we offer further carbon filtration and UV disinfection in order that you may use the water for potable uses such as washing, showering or bathing. The water is ph neutral and mixes detergent much better than mains and as such better to wash hair or clothes with or anything else.

Above-Ground Tank Range

Under-Ground Tank Range

As regard controls, we can offer very simple non visual controls (very cost effective) up to full system controls with lcd display and gives information such as pressure, water depth, header tank and pump status and can offer information such as rainwater used and mains water used in order you can see the savings.

Control systems

We offer two types of systems, either a direct system (pressure system) or an indirect system (gravity system). With the direct system, there is no header tank and the water is pumped directly to the appliances which has good pressure. With the indirect system, the water is pumped to a header tank and feeds the appliances by gravity, where you will have water stored if there is a power cut.

With our commercial or domestic rainwater harvesting systems, we have the system to suit the owner's project requirements. With simplicity and cost effectiveness in mind, we will establish the essentials for your application and build a system on that. We can survey the premises and offer full design, supply and commissioning. We also offer full installation with all our systems.

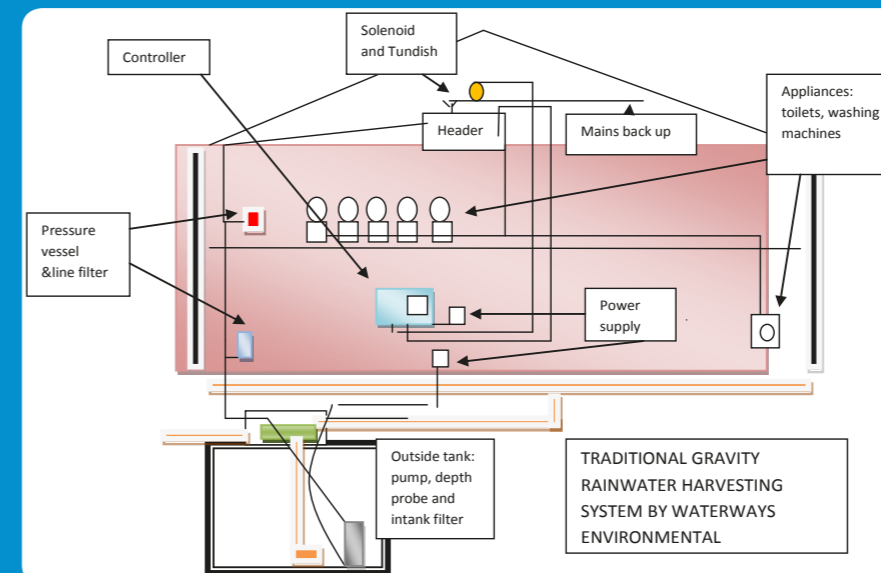

All our systems conform to BS8515:2009. All items CE marked in compliance with full EU standards.

Accessories

1. Stainless steel pumps 2. Floating intake 3. Pressure vessels 4. Divertron pumps 5. Inline filters
